# **Probability & Statistics**

## **Experiment 1**

Q1. Create a vector c = [5,10,15,20,25,30] and write a program which returns the maximum and minimum of this vector.

```
vc=c(5,10,15,20,25,30)
cat("Vector C: ",vc,"\n")
cat("Maximum of vector C = ",max(vc),"\n")
cat("Minimum of vector C = ",min(vc))
```

#### **Output:**

```
Vector C: 5 10 15 20 25 30

Maximum of vector C = 30

Minimum of vector C = 5
```

Q2. Write a program in R to find factorial of a number by taking input from user. Please print error message if the input number is negative.

```
x=as.integer(readline("Enter the number: "));
y=factorial(x);
if(x<0){print("Error. Number cannot be negative.")
}else{print(paste("Factorial of ",x," = ",y))
}</pre>
```

#### **Output:**

```
Enter the number: 3
Factorial of 3 = 6
>
> source("D:/C Data/Documents/Lab1_Q2.R")
Enter the number: -2
[1] "Error. Number cannot be negative."
```

Q3. Write a program to write first n terms of a Fibonacci sequence. You may take n as an input from the user.

```
var=readline(prompt = "Enter a number : ")
n=as.integer(var)
n1=as.integer(0)
n2=as.integer(1)
if(n<=0){
  print('Please enter a positive number')
}else{
  if(n==1){
    cat("Fibonacci series :",n1)
  }else if(n==2){
    cat("Fibonacci series :",n1,",",n2)
}else{</pre>
```

```
cat("Fibonacci series:",n1,",",n2)
  count=as.integer(2)
  while(count<n){
  count=count+1
   nth=n1+n2
   n1=n2
  n2=nth
  cat(", ",nth)
  }
}
}
Output:
Enter a number : 5
Fibonacci series: 0, 1, 1, 2, 3
Q4. Write an R program to make a simple calculator which can add, subtract, multiply and divide.
n1=as.integer(readline("Enter a number: "));
n2=as.integer(readline("Enter another number: "));
ch=as.integer(readline("Enter your choice : "))
ans=switch (
 ch,
 "1"= cat("Addition = ",n1+n2),
"2"= cat("Subtraction = ",n1-n2),
 "3"= cat("Multiplication = ",n1*n2),
 "4"= cat("Division = ",n1/n2)
Output:
> source("D:/C Data/Documents/Lab1_Q4.R")
Enter a number : 6
Enter another number: 2
Enter your choice : 1
Addition = 8
> source("D:/C Data/Documents/Lab1_Q4.R")
Enter a number : 6
Enter another number : 2
Enter your choice: 2
Subtraction = 4
> source("D:/C Data/Documents/Lab1_Q4.R")
Enter a number : 6
Enter another number : 2
Enter your choice: 3
Multiplication = 12
> source("D:/C Data/Documents/Lab1_Q4.R")
```

Enter a number : 6

Division = 3

Enter another number : 2 Enter your choice : 4

## **Experiment 2**

(1) (a) Suppose there is a chest of coins with 20 gold, 30 silver and 50 bronze coins. You randomly draw 10 coins from this chest. Write an R code which will give us the sample space for this experiment. (use of sample(): an in-built function in R) (b) In a surgical procedure, the chances of success and failure are 90% and 10% respectively. Generate a sample space for the next 10 surgical procedures performed. (use of prob(): an in-built function in R)

- (2) A room has n people, and each has an equal chance of being born on any of the 365 days of the year. (For simplicity, we'll ignore leap years). What is the probability that two people in the room have the same birthday?
  - (a) Use an R simulation to estimate this for various n.
  - (b) Find the smallest value of n for which the probability of a match is greater than .5.

```
#Q2 (a)
n=400
num=1
for(i in 0:n){
 num=num*((365-i)/365)
ans=1-num
print(ans)
Output:
#Q2 (a)
n=400

    num=1

- for(i in 0:n){
   num=num*((365-i)/365)
ans=1-num
print(ans)
1] 1
```

```
#Q2 (b)
n=1
ans=0
while(ans<0.5){
n=n+1
 num=1
for(i in 0:n){
 num=num*((365-i)/365)
ans=1-num
print(n)
Output:
 #Q2 (b)
 n=1
 ans=0
 while(ans<0.5){
   n=n+1
   num=1
   for(i in 0:n){
     num=num*((365-i)/365)
   ans=1-num
 }
 print(n)
1] 22
```

- (3) A room has n people, and each has an equal chance of being born on any of the 365 days of the year. (For simplicity, we'll ignore leap years). What is the probability that two people in the room have the same birthday?
  - (a) Use an R simulation to estimate this for various n.
  - (b) Find the smallest value of n for which the probability of a match is greater than .5.

```
#Q3
p_cloudy <- 0.40
p_rain <- 0.20
p_cloudy_rain <- 0.85
p_cloudy_int_rain <- p_cloudy_rain*p_rain
p_rainy_cloudy <- p_cloudy_int_rain/p_cloudy
print(p_rainy_cloudy)</pre>
```

#### **Output:**

```
> #Q3
> p_cloudy <- 0.40
> p_rain <- 0.20
> p_cloudy_rain <- 0.85
> p_cloudy_int_rain <- p_cloudy_rain*p_rain
> p_rainy_cloudy <- p_cloudy_int_rain/p_cloudy
> print(p_rainy_cloudy)
[1] 0.425
```

- (4) The iris dataset is a built-in dataset in R that contains measurements on 4 different attributes (in centimeters) for 150 flowers from 3 different species. Load this dataset and do the following:
  - (a) Print first few rows of this dataset.
  - (b) Find the structure of this dataset.
  - (c) Find the range of the data regarding the sepal length of flowers.
  - (d) Find the mean of the sepal length.
  - (e) Find the median of the sepal length.
  - (f) Find the first and the third quartiles and hence the interquartile range.
  - (g) Find the standard deviation and variance.
  - (h) Try doing the above exercises for sepal.width, petal.length and petal.width.
  - (i) Use the built-in function summary on the dataset Iris.

#Q4 data<-iris print(head(data))

range(data\$Sepal.Length)
mean(data\$Sepal.Length)
median(data\$Sepal.Length)
quantile(data\$Sepal.Length,0.25)
quantile(data\$Sepal.Length,0.75)
IQR(data\$Sepal.Length)
sd(data\$Sepal.Length)
var(data\$Sepal.Length)
lapply(data[,1:4],sd)
summary(data)

### **Output:**

(5) R does not have a standard in-built function to calculate mode. So we create a user function to calculate mode of a data set in R. This function takes the vector as input and gives the mode value as output.

```
#Q5
getmode <- function(v) {
  uniqv <- unique(v)
  uniqv[which.max(tabulate(match(v, uniqv)))]</pre>
```

```
}
v <- c(1,1,2,3,4,2,4,2,5)
result <- getmode(v)
print(result)

Output:
> #Q5
> getmode <- function(v) {
+ uniqv <- unique(v)
+ uniqv[which.max(tabulate(match(v, uniqv)))]
+ }
> v <- c(1,1,2,3,4,2,4,2,5)
> result <- getmode(v)
> print(result)
[1] 2
```
